## Adding product codes and keywords

Ensuring that your company registers under the product and service codes that match your capabilities is one of the most important aspects of completing the questionnaire. The product and service codes are the primary means for buyers to source suppliers and/or contractors to match their contract requirements. It is essential to give careful consideration and allow adequate time to review all of the available product and service codes and keywords, in order to maximise your company's chances of being identified by a buyer for a relevant contract opportunity.

## How to select product and service codes for your company

This guide provides all the product and service codes and their associated keywords.

There are four tiers in the coding structure which are divided into the following areas:

1. General Business Products
2. General Business Services & Works
3. Sector Specific Products
4. Sector Specific Services & Works

Each area is sub-divided into a number of subsections, listed on p.4.

In the system, to select your product codes, you will need to navigate through a tree structure:

- Pick a Level 1 product and service code. This will then display all the available Level 2 codes.
- Pick a Level 2 product and service code. This will then display all the available Level 3 codes.
- Pick and register under the Level 3 codes that most closely reflect the products or services you supply

NB. The number of Level 3 codes chosen may affect the subscription level that you require.

## Keywords

Once you have identified the right product codes, remember to check for available keywords. Many product and service codes have a selection of keywords, which are designed to make identification of the correct codes easier for suppliers, contractors and buyers. The keywords have been selected by the buying organisations to help ensure they source the most appropriate suppliers for tender opportunities. The keywords work by providing a further level of classification to the product and service code, which can sometimes be quite generic. These are listed in grey text beneath the code in

the guide book, and are often incorporated into the user's search criteria.

Where keywords do not exist, or existing keywords are inappropriate, you may enter your own description.

Example – how to use keywords

### 1.1.32 Lifts & Escalators

Keywords

- Lifts – Passenger
- Lifts – Wheelchair
- Lifts – Cargo

In the above example, 1.1.32 is the correct code for a supplier of Lifts & Escalators. The keywords clearly enable suppliers to demonstrate the specific type of lifts and escalators they can provide (you can select one or all of the keywords as appropriate).

Voltage descriptions

In this version of the code set, the terms

- Low voltage
- Medium voltage
- High voltage

have been used. When selecting codes with these descriptions, reference should be made to IEC 60038 edition 7.0 and the following:

low voltage (abbreviation: LV)

a set of voltage levels used for the distribution of electricity and whose upper limit is generally accepted to be 1 000 V for alternating current

medium voltage (abbreviation: MV) (not used in the UK in this sense, nor in Australia)

any set of voltage levels lying between low and high voltage

Note – The boundaries between medium- and high-voltage levels overlap and depend on local circumstances and history or common usage. Nevertheless the band 30 kV to 100 kV frequently contains the accepted boundary.

high voltage (abbreviation: HV)

1. in a general sense, the set of voltage levels in excess of low voltage
2. in a restrictive sense, the set of upper voltage levels used in power systems for bulk transmission of electricity
